Committees

International Organizing Committee:

General Chairman: Dr. Igor Saveljić (Serbia)
Vice-chairmans: Dr. Nenad Janković (Serbia)
Prof. Dr. Urban Bren (Slovenia)

Members:

Dr Dejan Milenković (Serbia), Dr. Marijana Petković (Serbia), Dr. Marija Stanić (Serbia), Dr. Melina Kalagasidis Krušić (Serbia), Dr. Suzana Jovanović-Šanta (Serbia), Prof. Dr. Vladimir Ranković (Serbia), Dr. Marina Soković (Serbia), Dr. Mirjana Mihailović (Serbia), Prof. Dr. Vladimir Janjić (Serbia)

International Scientific Committee:

Chairman: Prof. Dr Nenad Filipović (Serbia)
Vice-chairmans: Academician Miloš Kojić (Serbia)
Academician Miloš Đuran (Serbia)
Prof. Dr. Zoran Marković (Serbia)
Prof. Dr. Xiaoping Chen (China)

Members:

Prof. Dr. Iztok Turel (Slovenia), Prof. Dr. Bakhtiyor Rasulev (USA), Prof. Dr. Ivan Gutman (Serbia), Prof. Nenad Kostić (USA), Prof. Dr. Demetrio Milea (Italy), Prof. Dr. Quan Yuan (China), Prof. Caroline Da Ros Montes D'Oca (Brazil), Dr. Danijela Bakarić (Croatia), Prof. Dr. Carlos Silva Lopez (Spain), Prof. Dr. Ferda Ari (Turkey), Prof. Dr. Miljan Milošević (Serbia), Dr. Edina Avdović (Serbia), Prof. Dr. Snežana Zarić (Serbia), Prof. Dr. Suzana Jovanović Šanta (Serbia), Dr. Željko Čupić (Serbia), Aleksandar Nešović (Serbia), Dr. Ana Rilak Simović (Serbia), Dr. Marko Živanović (Serbia), Dr. Jelena Katanić Stanković (Serbia), Dr. Milica Nikolić (Serbia), Dr. Dušica Simijonović (Serbia), Dr. Aleksandar Radaković (Serbia), Dr. Jasmina Obradović (Serbia), Dr. Dalibor Nikolić (Serbia), Dr. Jelena Đorović Jovanović (Serbia), Dr. Žiko Milanović (Serbia), Dr. Dejan Milenković (Serbia), Dr. Sonia Morya (India), Dr. Snežana Papović (Serbia), Prof. Dr. Biljana Ljujić (Serbia)

Local Executive Committee:

Chairman: Dr. Darko Ašanin (Serbia)
Vice-chairmans: Dr. Marko Antonijević (Serbia)
Dr. Vladimir Simić (Serbia)

Members:

Jelena Živković (Serbia), Bogdan Milićević (Serbia), Lazar Kostić (Serbia), Petar Stanić (Serbia), Aleksandra Marković (Serbia), Tamara Mladenović (Serbia), Aleksandar Nešović (Serbia), Emilija Milović (Serbia), Jovana Matić (Serbia), Nevena Milivojević (Serbia), Danijela Stojković (Serbia), Marija Branković (Serbia), Jana Bašcarević (Serbia), Aleksandar Nikolić (Serbia), Lazar Milović (Serbia), Dr. Mirjana Grujović (Serbia), Dr. Katarina Marković (Serbia).

Abstract: The paper analyses the causal relationship between economic growth, renewable energy consumption, trade openness, and CO₂ emissions using a sample of 13 countries from 2006 to 2021. The JKS Granger non-causality test is applied. The results of the analysis show a bidirectional relationship between economic growth and CO₂ emissions. Additionally, there is a two-way causal relationship between CO₂ emissions and renewable energy consumption. Trade openness causes an increase in CO₂ emissions, but emissions do not, in turn, cause trade openness. This may be explained by the increasing role of renewable energy sources in offsetting fossil fuel dependence, while trade openness, particularly in developing economies, often leads to greater industrial activity and energy consumption, which in turn raises emission levels. The study highlights the interrelated nature of CO₂ emissions, economic growth, renewable energy use, and trade openness, emphasising the importance of coordinated policies for achieving carbon reduction and sustainable development. These findings offer valuable insights for policymakers aiming to design balanced strategies for energy transition and environmental protection.

Keywords: CO₂ emission, economic growth, renewable energy, trade openness, causality

1. Introduction

The interplay between economic activities, such as energy production, trade, and economic growth not only shapes overall human well-being and the functioning of a country's economic system, but also significantly contributes to climate change through increased carbon dioxide (CO₂) emissions and environmental degradation [1]. The paper aims to analyse the causal relationship between economic growth, renewable energy consumption, trade openness and carbon emissions because of the significant impact of climate change on economic activity. Economic growth can play a mitigating role in air pollution, thereby reducing its harmful impacts and environmental consequences [2].

Substantial evidence suggests that the increasing share of renewable energy in electricity generation serves as a key factor in reducing carbon emissions from the power sector, an effect that appears particularly pronounced during the early stages of economic development in Europe [3,4]. The role of renewable energy in the EKC

hypothesis has gained attention due to its potential to reduce environmental degradation and support sustainable growth. [5,6,7,8]. Trade openness, along with the interaction between economic growth and renewable electricity consumption, has been found to negatively affect environmental quality by contributing to increased CO₂ emissions [9,10]. This study is motivated by the lack of empirical research that jointly examines the causal relationships between these variables in Europe, as existing studies often address these factors separately.

2. Data and Methodology

The study covers 13 European countries: Albania, Bosnia and Herzegovina, Serbia, Montenegro, North Macedonia, Bulgaria, Romania, Croatia, Czechia, Hungary, Poland, the Slovak Republic and Slovenia from 2006 to 2021. The variables used in research are GDP per capita (GDPpc), renewable energy consumption (REC) and trade openness ((export+import)/GDP) – TO). Data are retrieved from the World Bank database [11] and Our World in Data [12].

After applying cross-sectional dependence tests and the second-generation unit root CIPS test, the JKS Granger non-causality test is applied. It was introduced a novel approach for testing the null hypothesis of no Granger causality, applicable to models with either homogeneous or heterogeneous coefficients [13,14]. It assumes the following econometric specification for panel data:

$$y_{it} = \phi_{0,i} + \sum_{p=1}^p \phi_{p,i} y_{i,t-p} + \sum_{p=1}^p \beta_{p,i} x_{i,t-p} + \tau_{i,t} \tag{1}$$

with $i=1, \dots, N$ and $t=1, \dots, T$. The model assumes that $x_{i,t}$ is scalar. The constant term $\phi_{0,i}$ captures individual-specific (non-group) effects, while $\tau_{i,t}$ denotes the disturbance terms. The parameters $\phi_{p,i}$ represent non-homogeneous autoregressive components for $p=1, \dots, P$, and $\beta_{p,i}$ denote non-homogeneous feedback coefficients [14]. Moreover, the null hypothesis that $x_{i,t}$ does not Granger-cause $y_{i,t}$ can be expressed as a set of linear restrictions on the parameters of equation: H0: $\beta_{p,i}=0, \forall i$ and p ; H1: $\beta_{p,i} \neq 0$ for some i and p . If the null hypothesis is not rejected, this suggests that past values of $x_{i,t}$ do not provide statistically significant information for predicting $y_{i,t}$ indicating the absence of Granger causality.

2. Results and Discussion

Three cross-sectional dependence tests are performed (Table 1).

Table 1. Cross-sectional dependence tests

Variable	Breusch-Pagan LM		Pesaran scaled LM		Pesaran CD	
	Statistic	p-value	Statistic	p-value	Statistic	p-value
CO2pc	545.1532	0.0000	37.40219	0,0000	9.758662	0.0000
GDPpc	1057.830	0.0000	78.44915	0,0000	32.42833	0.0000
REC	630.1951	0.0000	44.21099	0.0000	21.45932	0.0000
TO	780.2683	0.0000	56.22646	0.0000	25.06326	0.0000

Source: Authors' calculation

Table 1 presents that the null hypothesis is rejected at the significance level of 5%. Therefore, it can be concluded that all variables contain cross-sectional dependence. Based on these findings, a second-generation unit root test (CIPS test) is employed to ensure the reliability of stationarity analysis in panel data (Table 2)

Table 2. Unit root CIPS test results

Variable	t-stat	p-value	Critical level (5%)	Integration level
CO ₂ pc	-1.11968	≥0.10	-2.32	
dCO ₂ pc	-2.18356	≥0.10	-2.34	I(2)
ddCO ₂ pc	-3.29040	<0.01	-2.37	
GDPpc	-2.75880	<0.01	-2.32	I(0)
REC	-1.75731	≥0.10	-2.32	I(1)
dREC	-3.57620	<0.01	-2.34	
TO	-1.96845	≥0.10	-2.32	
dTO	-3.00188	<0.01	-2.34	I(1)

Source: Authors' calculation

The results presented in Table 2 indicate that the variable GDPpc is stationary at level. In contrast, the variables REC and TO exhibit non-stationarity at level but achieve stationarity after first differencing. The variable CO₂pc attains stationarity only after the second differencing. In the subsequent step, the causality relationship between CO₂pc and the other variables was examined using the JKS non-causality test (Table 3).

Table 3. JKS Granger non-causality test

Null Hypothesis	HPJ Wald Test	p-value	Conclusion
ddCO ₂ pc → GDPpc	4.3247	0.0376	Yes
GDPpc → ddCO ₂ pc	34.5145	0.0000	Yes
ddCO ₂ pc → dREC	7.2370	0.0071	Yes
dREC → ddCO ₂ pc	7.7382	0.0054	Yes
ddCO ₂ pc → dTO	0.6757	0.4111	No
dTO → ddCO ₂ pc	16.9482	0.0000	Yes

Source: Authors' calculation

A lag length of two was selected, taking into consideration the time dimension of the panel. The results indicate that CO₂ emissions exert a statistically significant influence on GDPpc. Moreover, economic growth significantly affects CO₂ emissions, as evidenced by an HPJ Wald test statistic of 34.5145. A bidirectional causality is also observed between CO₂ emissions and renewable energy consumption. Conversely, the test results suggest that CO₂ emissions do not Granger-cause trade openness, whereas trade openness is significantly influenced by CO₂ emissions, with an HPJ Wald test statistic of 16.9482.

4. Conclusion

The results highlight a complex interdependence between CO₂ emissions, economic growth, renewable energy, and trade openness, emphasising the need for integrated policies that align environmental sustainability with economic development, particularly in the context of carbon reduction and energy transition strategies.
